

The menu structure and navigation structure are now good to go. However, after reviewing the application more closely, I believe there are still significant gaps in the functionality, business logic, workflows, role responsibilities, dependencies, evidence capture, and KPI logic behind the three WISCA pillars.

I have attached the **WISCA 3-Pillars Harmonised Framework**:

C:\Users\NCC\Desktop\projects\wisca\chambers\WISCA_v2

This document should now be treated as the **primary functional reference/source of truth** for this review.

1. What I want us to establish

The objective is not simply to confirm that the application has menus and pages corresponding to the framework.

We need to establish whether the application can actually **execute the business processes described in the framework from beginning to end**.

For every:

Pillar → Activity → Measurable Sub-Activity

we need to determine:

- What must happen operationally?
- Who is responsible?
- What must exist before the activity can be performed?
- What information, document, record, approval, or master data is required?
- Who creates or provides that prerequisite?
- Who reviews or approves it?
- What should the responsible user actually do in the system?
- What evidence should be captured or uploaded?
- How is completion verified?
- How is the KPI calculated?
- How is the target measured?
- How frequently should the activity occur?
- What happens when the activity fails, is incomplete, rejected, or requires corrective action?
- What subsequent activity depends on the outcome?

The framework contains these dimensions explicitly:

Activity → Measurable Sub-Activity → KPI/Measure → Target → Frequency → Evidence/Verification → Responsibility

The application should therefore have sufficient functionality and data structures to support these relationships.

2. Example: Curriculum Coverage Rate

Use the following as an example of the type of logical gap I want us to investigate.

Under:

Pillar: Academic Excellence

Activity: Curriculum Coverage Rate

The first Measurable Sub-Activity is:

Plan curriculum delivery according to approved scheme of work

The framework specifies:

- **KPI:** % of termly schemes of work prepared with weekly broken-down learning objectives
- **Target:** 100%
- **Frequency:** Every Thursday of the week
- **Evidence/Verification:** Submission of Lesson Plan every Thursday
- **Responsibility:** Teachers

However, for a teacher to meaningfully perform this activity, the system must first have access to the **approved Scheme of Work** that serves as the standard/reference for curriculum planning.

This introduces several business-process dependencies that the current application does not appear to fully handle.

For example:

Approved Scheme of Work workflow

There should potentially be a mechanism for an authorized role to:

1. Upload the Scheme of Work.
2. Specify the relevant academic session.
3. Specify the term.
4. Specify the class/level.
5. Specify the subject.
6. Identify the applicable curriculum.
7. Submit it for review/approval where required.
8. Approve or reject it.
9. Maintain the approval status and history.
10. Make the approved version available to the appropriate teachers.
11. Prevent teachers from unknowingly planning against an outdated or unapproved version.

12. Maintain an audit trail of who uploaded, reviewed, approved, replaced, or amended the document.

The teacher should then be able to use the **approved Scheme of Work as the reference point for curriculum planning**, rather than simply submitting a standalone lesson plan without a controlled curriculum baseline.

This is only **one example**.

I want us to identify similar hidden dependencies throughout the entire framework.

3. Review All Three Pillars

Please conduct a comprehensive functional review of all three pillars in the attached framework:

Pillar 1 — Academic Excellence

Review every Activity and Measurable Sub-Activity and determine whether the existing application provides the functionality required to execute them.

Pay particular attention to dependencies such as:

- Approved curriculum/scheme of work
- Lesson plans and lesson notes
- Submission and approval workflows
- Curriculum coverage tracking
- Assessments and baseline assessments
- Learner performance records
- Intervention plans
- Attendance records
- Lesson observations
- HOD/HoS/AHS review and approval
- Evidence submission
- KPI calculations
- Progress tracking
- Corrective/catch-up actions

Pillar 2 — Christcentric Education

Review all Activities and Measurable Sub-Activities relating to:

- Devotions and chapel activities
- Christian character development
- Community service
- Restorative discipline
- Bullying/safeguarding

- Scripture memory and application
- Parent-school Christian culture alignment

Determine what records, workflows, approvals, assessments, evidence, follow-ups, and role responsibilities are required for each.

For example, if the framework requires a **restoration action plan**, the application should not merely provide a page for recording a discipline incident. It may require a workflow covering:

Incident → Investigation → Restorative Conversation → Action Plan → Implementation → Follow-up → Resolution → Evidence

The same principle should be applied throughout this pillar.

Pillar 3 — Digital Innovation

Review all Activities and Measurable Sub-Activities relating to:

- Digital Portal and LMS adoption
- Coding and STEM practical completion
- AI and technology ethics
- Staff digital competency
- Digital assessment and E-Portfolios
- Parent Portal engagement

Pay particular attention to dependencies such as:

- User account provisioning
- Training records
- LMS activity
- Digital assessments
- E-Portfolios
- Digital learning artifacts
- STEM inventory
- Coding projects
- AI-use monitoring
- Digital competency assessments
- Parent engagement records
- Helpdesk/support records
- Compliance and incident workflows

4. Compare the Framework Against the Existing Application

Please systematically compare the attached framework against the actual implementation in:

C:\Users\NCC\Desktop\projects\wisca\chambers\WISCA_v2

Inspect the relevant:

- Routes
- Controllers
- Models
- Migrations
- Database relationships
- Services
- Policies/permissions
- Roles
- Views/components
- Forms
- Dashboards
- Reports
- Existing workflows
- Validation logic
- KPI calculations
- Evidence/document handling
- Approval mechanisms

Do not assume that because a UI page exists, the underlying functionality is complete.

We need to distinguish between:

A. Fully implemented

The application can actually execute the intended business process.

B. Partially implemented

Some functionality exists, but important workflow, data, approval, evidence, or calculation logic is missing.

C. UI-only / Placeholder

A page, menu, form, or interface exists, but the underlying business process is not adequately implemented.

D. Completely missing

The framework requires functionality for which there is currently no meaningful implementation.

5. Identify Functional Dependencies

For every Measurable Sub-Activity, identify its dependencies.

Use this conceptual structure:

Prerequisite → Responsible Role → Action → Review/Approval → Evidence → Verification → KPI Calculation → Target → Follow-up/Corrective Action

For example:

Approved Scheme of Work
↓
Teacher
↓
Prepare Weekly Curriculum Plan
↓
HOD Review/Verification
↓
Lesson Plan Submission
↓
Curriculum Coverage Tracking
↓
KPI Calculation
↓
100% Target
↓
Gap Identification / Catch-up Plan

This should help us discover functionality that may not be obvious from the current UI.

6. Pay Particular Attention to Role-Based Workflows

The framework identifies different responsible roles, including, among others:

- Teachers
- HODs
- HoS
- AHS
- Chaplain
- ICT Coordinator
- Admin Manager

We need to verify that the application correctly reflects the responsibilities assigned to these roles.

For each workflow, determine:

- Who initiates it?
 - Who performs it?
 - Who reviews it?
 - Who approves it?
 - Who verifies it?
 - Who receives the resulting report?
 - Who can edit it?
 - Who can reject/return it?
 - Who can view it?
 - What happens after rejection or non-compliance?
-

7. Evidence and Verification Must Be Functional

The **Evidence / Verification** column in the framework is particularly important.

Where the framework specifies evidence such as:

- Lesson plans
- Attendance registers
- Assessment results
- Intervention plans
- Observation forms
- Character assessment forms
- Incident registers
- Training records
- E-Portfolios
- Project files
- Audit reports
- Certificates
- Support records

we need to determine whether the application actually provides a mechanism to **generate, upload, associate, verify, approve, store, retrieve, and report that evidence**.

Do not treat the evidence field as descriptive text only.

Where appropriate, it should translate into an actual system workflow.

8. KPI and Measurement Logic

The framework defines specific KPIs and targets.

Please verify whether the application has sufficient data and logic to calculate these KPIs accurately.

For example:

Target: $\geq 95\%$

The system should have a clearly defined numerator and denominator and should be able to determine how the percentage is calculated.

Where a KPI cannot currently be calculated because the required underlying data is not being captured, identify this as a **functional gap**.

Do not invent KPI formulas where the framework does not provide enough information. Flag such cases for discussion.

9. Identify Impact on the New Menu Structure

We have already agreed on the following navigation concept:

Pillar → Activity → Measurable Sub-Activities as Tabs

The new menu structure should therefore be considered together with the functional review.

For example:

Academic Excellence

→ **Curriculum Coverage Rate**

→ Tabs:

- Plan Curriculum Delivery
- Deliver Scheduled Curriculum
- Check Curriculum Coverage
- Identify Curriculum Gaps
- Review Coverage vs Understanding

Kindly note: Depending on your role or responsibility, you get to see which tab.

The tabs should not merely display different screens. They should represent the actual stages/functions required by the underlying business process.

Therefore, identify where the new structure will require changes to:

- Existing UI
- Forms

- Dashboards
- Workflows
- Role permissions
- Database relationships
- Routes
- Reports
- KPI calculations
- Evidence management
- Notifications
- Approval mechanisms

10. Required Output — Analysis Only

Do not modify the application at this stage.

Do not:

- Write code
- Modify database tables
- Create migrations
- Modify existing UI
- Change routes
- Change permissions
- Delete or rename existing functionality
- Deploy anything

First, produce a comprehensive **Functional & Business Logic Gap Analysis**.

The report should preferably use a structure similar to:

Pillar	Activity	Measurable Sub-Activity	Responsible Role	Required Prerequisites	Required Workflow	Evidence	KPI/Target	Current Implementation	Gap	Affected Modules/UI	Proposed Options
--------	----------	-------------------------	------------------	------------------------	-------------------	----------	------------	------------------------	-----	---------------------	------------------

For each identified gap, explain:

1. **What the framework requires**
2. **What the application currently does**
3. **What is missing**
4. **Why the missing functionality matters**
5. **Which roles are affected**
6. **Which existing modules/UI may be affected**
7. **Possible implementation approaches**
8. **Potential risks/dependencies**

11. Important: Discussion Before Implementation

At this stage, our goal is **discovery, analysis and design — not coding**.

Once you have completed the review, let's discuss the identified gaps and the available implementation options.

For major changes, especially those affecting existing UI, database structures, workflows, permissions, dashboards or reports, present the alternatives before recommending an approach.

Wait for my explicit confirmation before implementing anything.

The ultimate objective is to ensure that WISCA is not merely **visually aligned with the three-pillar framework**, but is functionally capable of executing, monitoring, verifying, measuring and reporting the operational processes defined by the framework.

The attached **WISCA 3-Pillars Harmonised Framework** should be used as the primary reference throughout this analysis.
